Moblize launches Enterprise Class WITSML Central Server for aggregating upstream data: The DARP® Central Server

Houston, TX May 23, 2008: **Moblize**, One of the industries leading innovators in next generation real time technology. Today Moblize announces the official release of WITSML compliant DARP® Central Server.

“ WITSML is a industry data standard and promotes openness, however current providers of WITSML solutions want to lock clients with their data management and viewers at high premiums. This will result in slow adoption of real value created by using WITSML as a backbone for drilling solutions. Moblize provides its clients the flexibility to buy virtually any component of the WITSML solution from data to decisions.” Says Amit Mehta, Principal of Moblize

DARP® Central Server is a WITSML integration platform that serves as the gateway to access well data gathered from a multitude of service companies. This central aggregator collects and aggregates both real-time and historic data provided from well sites storing them in any scalable database Oracle, Mysql, Microsoft SQL Server and etc. With DARP® Central Server both real-time data flow and historic data is accessible at a single source point.

Moblize's new aggregator allows users to directly connect to the diverse and comprehensive repository of well data gathered from multiple well sites, as well as real time data flowing from oil and gas vendors. Any WITSML compliant viewer and/or analysis system can access this data to enable companies to conduct well operations. Flexibility in access control is an essential feature of DARP® Central Server that restricts users from unauthorized access. DARP® Central Server is highly scalable and can handle and process data from an unlimited number of providers at high speeds. DARP® Central Server also provides an access-controlled query mechanism for specifying data formats to be retrieved, which are accessible through a web interface.
